                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression (antisense oligonucleotides, ribozymes, sense oligonucleotides and triplex-forming oligonucleotides), as probes for the detection of nucleic acids, and as auxiliaries in molecular biology. As gene expression inhibitors they may be used for treating viral infections (especially where the virus is HSV-1, HSV-2, an influenza virus, VSV, hepatitis B or papilloma virus), cancer, restenosis, medical conditions mediated by integrins or cell-cell adhesion receptors, and medical conditions induced by growth factors (especially TNF-alpha)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an inhibitor of HSV-1 gene expression, and example of an oligonuclectide analogue of the invention. The oligonuclectide analogues of the invention are used as inhibitors of
The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes the c-myb sequence and can be used to prevent smooth muscle cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17

                              The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1996-010927/01

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the maNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel phosphonomonoester oligonucleotide analogues which act as inhibitors of gene expression (as sense/antisense, ribozyme or triplex-forming molecules), useful as diagnostic agents (i.e. probes for detecting nucleic acid) or seful as diagnostic agents (i.e. probes for detecting nucleic acid) or of or triplex-forming molecules (i.e. probes for detecting nucleic acid) or of or triplex-forming molecules (i.e. probes for detecting nucleic acid) or of or triplex-forming molecules (i.e. probes for detecting nucleic acid) or of or triplex-forming molecules (i.e. probes for detecting nucleic acid) or of or other probes for detecting nucleic acid) or of or other probes for detecting nucleic acid) or of or other probes for detecting nucleic acid) or of or other probes for detecting nucleic acid) or other probes for detecting nucleic acid or oth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligo:nucleotide analogues contg. phospho:mono:ester bridges - therapeutic inhibition of gene expression, e.g. in cancer or viral infection, with good specificity and in vivo stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             viruses, influenced by integrins or cell-cell adhesion receptors, induced by factors such as TNF-alpha, or cancer or restenosis. The products of the invention satisfy the requirements of good in-vivo stability; ability to cross cellular and nuclear membranes, and specific binding to target nucleic acid better than known oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 23; 36pp; German

          The present sequence is a primer for the A. thaliana EIN2 (ethylene insensitive) locus. When transformed into plants EIN2 genomic DNA, or CDNA sequences (obtd. from the EIN2 locus) confer disease tolerance and ethylene insensitivity, with minimal injury or reduction in the harvest yield of saleable material. The plants with disease tolerance may have extensive levels of infection, but little necrosis and few or no lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plant sequences for ethylene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  They may also have reduced necrotic and water soaking chlorophyll loss may be virtually absent
                      The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRWA encoding 1 or more receptors of vascular endothelial growth factor (NGGP). A patient preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17
                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                             (RIBO-)

                                                                                                                                                                                                                                                  The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                               stability - useful for treating e.g. turbeumatoid arthritis, etc., in a human
                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-OCT-1995;

CHOWRIRA B

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, central nervous system injury.

Claim 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates corpression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a comparison of a neurite growth inhibitor gene (NGGO). The comparison of a nucleic acids (e.g. a ribozyme or a comparison of a nucleic acids (e.g. a ribozyme or a comparison of cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) processor of the cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a CD20) trate is preferably Mg^2 + the comparison of the collague RNA of CD20 in the presence of a divalent cation that is preferably Mg^2 + conferency it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of targetting nucleic acid may be used to treat tymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic lymphoma, low-grade or follicular NHL, lymphoma, low-grade lymphoma, low-grade lymphoma, low-grade lymphoma, low-grade lymph

                                                                                                                                                                                                                                                                                       Nucleic acid molecules, e.g., enzymatic nucleic acids and constructs, which down regulate expression of a CD20 gene growth inhibitor gene useful for treating, e.g., lymphoma,
  The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-FEB-2000; 2000US-0181797P.

CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA CO of CD20 in the presence of a divalent cation that is preferably Mg^2^+. CC Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level CC of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-CC (Hodgkin's lymphoma (NHL), bulky low-grade or follicular MHL, lymphocytic (leukaemia, HCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunodeficiency virus) associated MHL, mantle-cell (lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, climant trombccytopaenia, and inflammatory arthropathy. The NCGO-CC (leukaemia, HCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, climant trombccytopaenia, and inflammatory arthropathy. The NCGO-CC (leukaemia, HCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, climant trombccytopaenia, and inflammatory arthropathy. The NCGO-CC (leukaemia, HCC) acid may be contacted with the CC (leukaemia, HCC) acid may be contacted with a cell to reduce NCGO activity of the CC (leukaemia) be contacted with a cell to reduce NCGO activity of the CC (leukaemia) be contacted with a cell to reduce NCGO activity of the CC (leukaemia) be contacted with the level of the contacted with the level of the contacted with the level of the seasociated with the level of the seasociated with the level of coll may be contacted with the level of the seasociated with the level of the seasociated with the level of coll may be contacted wi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; Parkinson's disease; ataxia; Huntington's disease; rearbrowascular accident; CVA; Alzheimer's disease; rearbrowascular dystrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease;
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-tazgetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2^+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise these of one or more theraples. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurity growth inhibitor gene useful for treating, e.g., lymphoma, leukemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12-MAR-2002 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABK00899

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), inmunocytoma (IMC), small B-cell lymphocytic lymphoma, commune thrombocytopaemia, and inflammatory arthropathy. The NGGO-commune thrombocytopaemia, and inflammatory arthropathy. The NGGO-commune thrombocytopaemia, and inflammatory arthropathy. The NGGO-commune of a divalent cation that is preferably Mg^2+. Furthermore, the concleic acid may be contacted with a cell to reduce NGGO activity of the CC land treat a patient having a condition associated with the level of CC NGGO. The treatment may further comprise the use of one or more concluded to the central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MG), CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), C arkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob concludes a statia, strong of the modulation of NGGO expression. The present concludes a statia and contaction of NGGO expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The invention relates to a nucleic acid molecule which down regulates conservession of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNazyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an RNF motif), a G-cleaver (cleaving RNA with a NYM motif) processing an environment of color of color. The treatment may further comprise the use of one or more contacted (MHL) bulky low-grade or follicular MHL, lymphoma, leukaemia, HrV (human immunodeficiency virus) associated WHL, mantle-cell lymphoma (MCL), immunocytcoma (IMC), small B-cell lymphoma, lymphocytic concessence of a divalent cation that is preferably. The MCGO color of co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          131; 200pp; English.

```
The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the coligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, trethoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A crethoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDXN2A), APC, Pactor V, Factor VIII, Factor IX, haemoglobin alpha locus 2 (HBA1), WHH1, MSH2, MSH6, applipaprotein E (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presenilin-1 (PSEN) and compresention adenosine deaminase deficiency, cystic fibrosis, thempshilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting coligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCAI, BRCAZ, CFTR, cyclin-dependent kinase inhibitor 2A retinoblastoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           27-MAR-2000; 2000US-0192176P.

                                                                                                                                                                                                                                                                                                                               The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as the protein surface-enhanced laser description ionisation.
                                                                                                                                                           therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; SEQ ID NO 6612; 214pp; English

The present invention describes a human genome-derived myosin-like CC protein 1 (hcDMLP-1). The protein and polynucleotide sequences of hGDMLP-CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1 curleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 curved in variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 capture probes for surface-enhanced laser description deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a construction and in the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The present sequence data for this pattent did not form part of the printed considered in the screening and the form part of the printed considered in the screening of the present invention, but was obtained in electronic format directly from WIPO at fire present did not form part of the printed considered proteins and the company to the present did not form part of the printed considered proteins and the company to the present did not form part of the printed considered proteins and printed directly from WIPO at fire present did not form part of the printed considered proteins and the considered proteins and the considered proteins and the considered proteins and the considered proteins and th

The present invention describes a human genome-derived myosin-like protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hgDMLP-1 color in gene therapy and vaccine production. The hgDMLP-1 color incleic acids can be used as probes to detect, characterise and quantify complete incleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hgDMLP-1 color variants having desired phenotypic improvements, and for expressing the proteins. The hgDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hgDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hgDMLP proteins, as specific biomolecule capture probes for surface-enhance laser description ionisation, as the capture probes for surface-enhance laser description ionisation, as complement in patients having specific deficiency in hgDMLP-1 colored associated with the expression of hgDMLP-1 may be used for diagnosing a disorder associated with the expression of hgDMLP-1 in particular heart cand skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence of the spatial did not form part of the printed consideration, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO consideration.

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

2002-179446/23.

The present invention describes a human genome-derived myosin-like protein 1 (homMLP-1). The protein and polynucleotide sequences of homMLP-1 can be used in gene therapy and vaccine production. The homMLP-1 nucleic acids can be used as probes to detect, characterise and quantify homolule-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of homMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The homolule-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise homolule-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and/or amount specifically of hgDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapputic supplement in patients having specific deficiency in hgDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hgDMLP-1 may be used for diagnosing a disorder associated with the expression of hgDMLP-1, in particular heart and skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hgDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fifty.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; genome-derived myosin-like protein 1; GDMLP-1; muscle; myosin; chromosome 22; gene therapy; vaccine; skeletal muscle disorder; amplicon; screening; ss.

Correction 1 (hopMilp-1). The protein and polynuclectide sequences of hopMilp-1 can be used in gene therapy and vaccine production. The hopMilp-1 community acids can be used as probes to detect, characterise and quantify compounded initial substrates for the recombinant engineering of hopMilp-1 compounded initial substrates for the recombinant engineering of hopMilp-1 compounded initial substrates for the recombinant engineering of hopMilp-1 compounded in a probes for the recombinant engineering of hopMilp-1 protein or proteins and for compounded in the proteins. The hopMilp-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hopMilp-1 proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as compounded in patients having specific deficiency in hopMilp-1 compounded and in vaccines or for replacement therapy. The concentration of disorder associated with the expression of hopMilp-1, in particular heart cand skeletal muscle disorders. hopMilp-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hopMilp-1 sequence data for this patent did not form part of the printed concentration, but was obtained in electronic format directly from WIPO at fifth the present invention. N.B. of the printed concentration, but was obtained in electronic format directly from WIPO at fifth the present sequence and obtained in electronic format directly from WIPO at fifth the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present

The present invention describes a human genome-derived myosin-like CC protein 1 (hcDMLP-1). The protein and polynucleotide sequences of hcDMLP-1 can be used in gene therapy and vaccine production. The hcDMLP-1 cC nucleic acids can be used as probes to detect, characterise and quantify comproved initial substrates for the recombinant engineering of hcDMLP-1 cC protein variants having desired phenotypic improvements, and for expressing the proteins. The hcDMLP-1 proteins or polypeptides may be cused as immunogens to raise antibodies that specifically recognise hcDMLP-1 proteins, as specific biomolecule and/or amount specifically of hcDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as characteris for surface-enhanced laser description ionisation, as concentration, and in vaccines or for replacement the concentration cC production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hcDMLP-1 may be used for diagnosing a cC disorder associated with the expression of hcDMLP-1, in particular heart cand skeletal muscle disorders. hcGMLP-1 is localised to chromosome 22. The present sequence in the expression of the present invention. N.B. The present sequence data for this patent did not form part of the printed cc specification, but was obtained in electronic format directly from WIPO at first wipo.int/pub/published_pct_sequence

                                                                                                                                                                                The present invention describes a human genome-derived myosin-like protein 1 (hcDMLP-1). The protein and polynuclectide sequences of hcDMLP-1 cc lan be used in gene therapy and vaccine production. The hcDMLP-1 cc mucleic acids can be used as probes to detect, characterise and quantify composed initial substrates for the recombinant engineering of hcDMLP-1 provide initial substrates for the recombinant engineering of hcDMLP-1 cc protein variants having desired phenotypic improvements, and for expressing the proteins. The hcDMLP-1 proteins or polypeptides may be composed as immunogens to raise antibodies that specifically recognise hcDMLP-1 used as immunogens to raise antibodies that specifically recognise hcDMLP-1 cc and/or amount specifically of hcDMLP proteins, as specific bicmolecule capture probes for surface-enhanced laser desorption ionisation, as cc capture probes for surface-enhanced laser desorption ionisation, as conjunction, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The comply nucleotide sequences encoding hcDMLP-1 may be used for diagnosing a cd disorder associated with the expression of hcDMLP-1 in particular heart cand skeletal muscle disorders. hcDMLP-1 is localised to chromosome 22.

Cc The presents equence represents an oligomer used in the screening of the present sequence data for this patent did not form part of the printed capture wise, int/pub/mblished net sequence.

CC protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cc nucleic acids can be used as probes to detect, characterise and quantify cc hGDMLP-1 nucleic acids in samples, as amplification substrates, to cc provide initial substrates for the recombinant engineering of hGDMLP-1 cc provide invariants having desired phenotypic improvements, and for cc expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP proteins, as standards in assays used to determine the concentration capture probes for surface-enhanced laser description ionisation, as cc therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The collar sequences encoding hGDMLP-1 may be used for diagnosing a cd disorder associated with the expression of hGDMLP-1, in paticular heart can disorder associated with the expression of hGDMLP-1, in paticular heart can disorder associated with the expression of hGDMLP-1, in paticular heart can disched a sequence of the expression of hGDMLP-1 is equence data for this patent did not form part of the printed content of the printed capture of the printed capture.

The present invention describes a human genome-derived myosin-like CC protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hgDMLP-1 can be used in gene therapy and vaccine production. The hgDMLP-1 culleic acids can be used as probes to detect, characterise and quantify checking in the protein probes to detect, characterise and quantify considering in the protein probes for the recombinant engineering of hgDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hgDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hgDMLP cused as immunogens to raise antibodies that specifically recognise hgDMLP capture probes for surface-enhanced laser description ionisation, as capture probes for surface-enhanced laser description ionisation, as complement in patients having specific deficiency in hgDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hgDMLP-1, in particular heart can be seeded as the description in the particular heart contents and skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-JAN-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17
The invention relates to a novel isolated nucleic acid encoding human KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the invention has cytostatic activity. The nucleotide may have a use in gene therapy. The KTOM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOM1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            21-SEP-2001;

New human kidney tumor overexpressed membrane (KTOM1) protein and nucl acids encoding the protein, useful for treating subjects having defect in KTOM1 which can manifest as cancer of the kidney, or as a disorder e.g., liver or bone.

n and nucleic ing defects disorder of

WPI; 2002-479509/51

therapy.

KTOM1 (kidney invention has

relates to a novel isolated nucleic acid ence tumour overexpressed membrane) protein. The prostatic activity. The nucleotide may have KTOM1 nucleic acids may be used to diagnose, t

protein e a use i

f the

or in human

invention

)M1 (kidney

relates to cytostatic

s to a novel isolated nucleic acid encoding human overexpressed membrane) protein. The protein of a atic activity. The nucleotide may have a use in g

n of the in gene

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shared an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was

gimilar

SPA

Novel isolated human testis expressed Patched like protein (HTPL), use for identifying agonist and antagonist and specific binding partners.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapy. The KTOM1 nucleic acids may be used to diagnose, treat or monitor a disease caused by altered expression of human KTOM1. Compositions comprising the nucleic acids, proteins or antibodies may used to treat subjects having defects in KTOM1 which can manifest as cancer of the kidney, as well as a disorder of liver, bone marrow, by heart, lung, kidney, colon, skeletal muscle, testis, uterus and place function. The sequence represents a probe used in the invention to so the nt 1-1001 portion of human KTOM1a (ABQ63232)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeuttc agents formale infertility and cancer. The present oligonucleotide was used in an example from the invention
                                           The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG), (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's Barcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; sturge Weber syndrome; leukaemia; ss; Osler-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;
               vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, St
Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
                                                                                                                                                                               arthritis,
                                                                                                                                                                                                                                                                                                              (RIBO-)
                                                                                                                                                                                                                                                                                                                                                               16-MAY-2000; 2000US-00572021

                                                                                                                   by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies curder conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or combined therapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically the regulate present nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and cenzymatic nucleic acid molecules which regulate expression of ERG, and cenzymatic nucleic acid molecules which regulate expression of ERG, and

CC The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc hybridizes to them under highly stringent conditions, or the complement co fany of them, or the corresponding RNA. The novel isolated nucleic acid so f the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypoptides. Any of the nucleic acid, e.g. as one component of pharmaceutianing the nucleic acids, cells containing the vector or antibodies directed against the polypoptides are useful for preparation, specifically cancer but also Alpheimer's disease and compensation, specifically cancer but also Alpheimer's disease and compatient samples is useful for diagnosis and/or prognosis of these companies. The polypoptides can also be used to generate antibodies, and compatient samples is useful for diagnosis and/or prognosis of these companies. The nucleic acid sequences of the invention can be used in generate antibodies, and companies. The nucleic acid sequences of the invention can be used in generate antibodies, and companies of the sequences of the invention can be used in generate antibodies. The nucleic acid sequences of the invention can be used in generate components of protein companies. The polypoptide call sequences of the invention can be used in generate antibodies are useful as components of protein companies. The nucleic acid sequences of the invention can be used in generate antibodies and companies of the components of protein components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 185

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NPEB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg 2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-DEC-1992;

proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     វាភព ដុង្គ
                                                 The present invention relates to novel human zinc finger-containing corporations and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is coded at chromosome 792.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome (MDZ7), and MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for dispnosing or monitoring a disease (CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The CC vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequence shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ6524, ABZ66530 - ABZ66524, ABZ66530 - ABZ66535 represent substrate/target sequences for the human representations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encorner, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-MAY-2001; 2001US-0294140P

```
acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ66216, ABZ664544 - ABZ65531, ABZ66520 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                               Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encod HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                29-MAY-2001; 2001US-0294140P.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stabbility of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense cand more mucleic acid molecules include antisense cand more mucleic acids such as hammerhead ribozymes, DNAzymes, antisense are nucleic acid decoy molecules and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV by and or minus strand DNAzyme sequences disclosed in the present
                                                                             Query Match

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HEV) RNA. The nucleic acid molecules include antisense and company of the cacids such as hammerhead ribozymes, DNAsymes, antisense cc inozymes, zinzymes, amberzymes, and G-cleever ribozymes, Also disclosed care nucleic acid decoy molecules and aptamers that bind to HBV reverse cc transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and compounds of the invention are useful for the treatment of degenerative and clisease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carbon as cirrhosis, liver failure, and hepatocellular compounds or minus strand DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Blatt L,
